

# PARENTAL RESILIENCE

PROTECTIVE & PROMOTIVE FACTORS

Being a parent can be a very rewarding and joyful experience. But being a parent can also have its share of stress. Parenting stress is caused by the pressures (stressors) that are placed on parents personally and in relation to their child:

- *typical events and life changes* (e.g., moving to a new city or not being able to soothe a crying baby)
- *unexpected events* (e.g., losing a job or discovering your child has a medical problem)
- *individual factors* (e.g., substance abuse or traumatic experiences)
- *social factors* (e.g., relationship problems or feelings of loneliness and isolation)
- *community, societal or environmental conditions* (e.g., persistent poverty, racism or a natural disaster)

Numerous researchers have concluded that how parents respond to stressors is much more important than the stressor itself in determining the outcomes for themselves and their children. **Parents are more likely to achieve healthy, favorable outcomes if they are resilient. Resilience is the process of managing stress and functioning well even when faced with challenges, adversity and trauma.**

Some stressors parents face can be managed easily so that problems get resolved; for example, calling a relative or friend to pick-up a child from school when a parent is delayed. But some stressors cannot be easily resolved. For example, parents cannot “fix” their child’s developmental disability, erase the abuse they suffered as a child or be able to move out of a crime-plagued neighborhood. **Rather, parents are resilient when they are able to call forth their inner strength to proactively meet personal challenges and those in relation to their child, manage adversities, heal the effects of trauma and thrive given the unique characteristics and circumstances of their family.**

Demonstrating resilience increases parents’ self-efficacy because they are able to see

evidence of both their ability to face challenges competently and to make wise choices about addressing challenges. Furthermore, parental resilience has a positive effect on the parent, the child and the parent-child relationship. By managing stressors, parents feel better and can provide more nurturing attention to their child, which enables their child to form a secure emotional attachment. Receiving nurturing attention and developing a secure emotional attachment with parents, in turn, fosters the development of resilience in children when they experience stress.

Sometimes the pressures parents face are so overwhelming that their ability to manage stress is severely compromised. This is the case with parents who grew up in environments that create **toxic stress**. That is, as children, they experienced strong, frequent and prolonged adversity without the buffering protection of nurturing adult support. As a result, these parents may display symptoms of depression, anxiety, or other clinical disorders that inhibit their ability to respond consistently, warmly and sensitively to their child’s needs. For example, depressive symptoms in either mothers or fathers are found to disrupt healthy parenting practices so that the child of a depressed parent is at increased risk of poor attachments, maltreatment and poor physical, neurological, social-emotional, behavioral and cognitive outcomes. However, numerous research studies show parents can be helped to manage clinical symptoms and reactions to their own histories of poor attachments and trauma, to protect children from adversity and trauma as best they can and to provide more nurturing care that promotes secure emotional attachment and healthy development in their children.

All parents experience stress from time-to-time. Thus, parental resilience is a process that all parents need in order effectively manage stressful situations and help ensure they and their families are on a trajectory of healthy, positive outcomes.
